

Core Processes

There are sets of core processes necessary for effective identity and access management.

How effective are the processes within and beyond your organization?

Many organizations make the mistake of looking for a technological silver bullet for their identity and access management issues. They buy a product then try to force their cumbersome and ineffective processes into the tool. No wonder so many efforts fail.

- Understand the user management lifecycle for each of your user types
- Develop your common process areas across all user types
- Measure your process effectiveness
- Refine your processes based on your metrics

Understanding, refining and managing your core IAG processes can make or break your IAG program. Having a process framework in place can help.
